

Name: Shweta Chauhan

Lab: Lab 1

Date: 3/17/2022

a. Program Description:

The purpose of this program is to print name, lab name and current date and time. To print, I have used the print() function. Passed the variables inside the print() function with formatting to include spaces before the output.

In addition to that I have imported the datetime class from datetime module in my source code. I have used the now() function from datetime class to get the current date and time. I have also used strftime() function to convert date and time objects to their string representation. The format uses abbreviated month name followed by day of the month and year. I have used a 12 hour clock format for printing in the format HH:MM:SS with the locale's AM or PM.

b. Program Source Code:

```
from datetime import datetime
#This program is to print name, lab name and current time and the message Hello World
name = "CNET-142 - Shweta Chauhan"
#Printing Name based on the variable defined as name
print("{:14}".format("Name"), ":", name)
lab = "Lab 1 - Hello World"
#Printing Lab name based on the variable defined as lab
print("{:14}".format("Lab"), ":", lab)
#Taking current date and time
currentTime = datetime.now()
timestamp_str = currentTime.strftime("%b-%d-%Y %a (%I:%M:%S%p)")
#Printing current date and time based on the variables defined as timestamp_str
print("{:14}".format("Current Time"), ":", timestamp_str)
```

c. Program Output

```
C:\Users\shwetachauhan\PycharmProjects\pythonProject\venv\Scripts\python.exe C:/Users/shwetachauhan/PycharmProjects/Course_scripts/print_me_first.py
Name           : CNET-142 - Shweta Chauhan
Lab            : Lab 1 - Hello World
Current Time    : Mar-17-2022 Thu (11:33:53PM)
```
